5.1 Shell-and-Tube Heat Exchangers - Homepages at WMU Also known as shell and tube heat exchangers, these transfer heat using liquid or steam that flows through the shell to heat or cool liquid in the tubes. They ' re commonly used in refrigeration and engine cooling systems. Btu/hr. cooling capacity is based on cooling 180 ° F process water with 85 ° F water and a 10 psi pressure difference. Heat exchangers with a 316 stainless steel shell and ...

Shell-and-Tube Heat Exchangers | McMaster-Carr A shell and tube heat exchanger is a class of heat exchanger designs. It is the most common type of heat exchanger in oil refineries and other large chemical processes, and is suited for higher-pressure applications. As its name implies, this type of heat exchanger consists of a shell with a bundle of tubes inside it. One fluid runs through the tubes, and another fluid flows over the tubes to transfer heat between the two fluids. The set of tubes is called a tube bundle, and may be composed of s

TECHNICAL CATALOGUE Section 5 Shell and Tube Models The shell and tube exchanger consists of four major parts: Front Header—this is where the fluid enters the tubside of the exchanger. It is sometimes referred to as the Stationary Header. Rear Header—this is where the tubside fluid leaves the exchanger or where it is returned to the front header in exchangers with multiple tubside passes.

SHELL AND TUBE HEAT EXCHANGERS - Thermopedia Most shell-and-tube heat exchangers have multiple " passes " to enhance the heat transfer. Here is an example of a 1-2 (1 shell pass and 2 tube passes) heat exchanger. As you can see, in a 12 heat exchanger, the tube- -side fluid flows the entire length of the shell, turns around and flows all the way back.

Chapter 5 Heat Exchangers A shell and tube heat exchanger must be designed to heat 2.5 kg/s of water from 15oC to 85oC. The heating is to be accomplished by passing hot engine oil, which is available at 160oC, through the shell side of the heat exchanger. The oil is known to provide an average convection coefficient of ho 400 W/m2 K on the outside of the tubes.

FUNDAMENTALS OF HEAT EXCHANGER DESIGN Shell and tube (a.k.a. multipass) heat exchangers are the most common industrial application for liquid/liquid heat exchange. They are not particularly well suited to gases. Shell and tube exchangers are generally less efficient than double pipe layouts, but are more compact and easier to build for a given duty. Layouts. TEMA (the Tubular Exchangers Manufacturers Association) publishes standards defining how shell and tube exchangers should be built.
