You can use this book to design a house for yourself with your family; you can use it to work with your neighbors to improve your town and neighborhood; you can use it to design an office, or a workshop, or a public building. And you can use it to guide you in the actual process of construction. After a ten-year silence, Christopher Alexander and his colleagues at the Center for Environmental Structure are now publishing a major statement in the form of three books which will, in their words, "lay the basis for an entirely new approach to architecture, building and planning, which will we hope replace existing ideas and practices entirely." The three

books are *The Timeless Way of Building*, *The Oregon Experiment*, and this book, *A Pattern Language*. At the core of these books is the idea that people should design for themselves their own houses, streets, and communities. This idea may be radical (it implies a radical transformation of the architectural profession) but it comes simply from the observation that most of the wonderful places of the world were not made by architects but by the people. At the core of the books, too, is the point that in designing their environments people always rely on certain "languages," which, like the languages we speak, allow them to articulate and communicate an infinite variety of designs within a formal system which gives them coherence. This book provides a language of this kind. It will enable a person to make a design

for almost any kind of building, or any part of the built environment. "Patterns," the units of this language, are answers to design problems (How high should a window sill be? How many stories should a building have? How much space in a neighborhood should be devoted to grass and trees?). More than 250 of the patterns in this pattern language are given: each consists of a problem statement, a discussion of the problem with an illustration, and a solution. As the authors say in their introduction, many of the patterns are archetypal, so deeply rooted in the nature of things that it seems likely that they will be a part of human nature, and human action, as much in five hundred years as they are today.

architectural design

Details the master architectural design plan currently being implemented at the University of Oregon, illustrating the participation of all members of a small community in the designing of their own environment

This introductory volume to Alexander's other works, *A Pattern of Language and The Oregon Experiment*, explains concepts fundamental to his original approaches to the theory and application of architecture

"These notes are about the process of design: the process of inventing things which display new physical order,

organization, form, in response to function." This book, opening with these words, presents an entirely new theory of the process of design. In the first part of the book, Christopher Alexander discusses the process by which a form is adapted to the context of human needs and demands that has called it into being. He shows that such an adaptive process will be successful only if it proceeds piecemeal instead of all at once. It is for this reason that forms from traditional un-self-conscious cultures, molded not by designers but by the slow pattern of changes within tradition, are so beautifully organized and adapted. When the designer, in our own self-conscious culture, is called on to create a form that is adapted to its context he is unsuccessful, because the preconceived categories out of which he builds his picture of

the problem do not correspond to the inherent components of the problem, and therefore lead only to the arbitrariness, willfulness, and lack of understanding which plague the design of modern buildings and modern cities. In the second part, Mr. Alexander presents a method by which the designer may bring his full creative imagination into play, and yet avoid the traps of irrelevant preconception. He shows that, whenever a problem is stated, it is possible to ignore existing concepts and to create new concepts, out of the structure of the problem itself, which do correspond correctly to what he calls the subsystems of the adaptive process. By treating each of these subsystems as a separate subproblem, the designer can translate the new concepts into form. The form, because of the process, will be well-adapted to its context,

San Francisco

The 1977 book "A Pattern Language" was a landmark in the design world, introducing a methodology that has since become remarkably widespread and effective across many fields. Among them is software, where "design patterns" have since become an industry standard. Important spinoffs include peer-to-peer collaboration technologies like wiki - the basis of Wikipedia and related innovations - as well as Agile Methodology. Yet curiously, the one field where pattern methodology has lagged most conspicuously is the one where it began, the built environment. In part, the popular appeal of the 1977 book served to "freeze" the initial set of patterns, greatly slowing further peer-to-peer development in

environmental design - contrary to the original authors' stated aims. As one remedy, we present here - in one of many more hoped-for future companion volumes to the original classic book - a new collection of 80 patterns for a new era of urban challenges, including rapid urbanization, slum upgrading, sustainable urbanism, [CUT: "new"] urban technologies, and new tools and strategies to meet these and other challenges. This new collection comes as a contribution to a five-year collaboration with UN-Habitat on implementation of the "New Urban Agenda," a framework document adopted by consensus by all 193 countries of the United Nations. However, there remains an urgent need to implement its humane aspirations, using tools and strategies grounded in research evidence, but also subject to revision, addition and

refinement with new findings from new collaborators. This volume aims to meet that need - together with the launch of an online companion pattern "repository", available at npl.wiki. Both initiatives were developed in collaboration with Ward Cunningham, wiki inventor, and pioneer of pattern languages of programming as well as Agile Methodology. Both are meant to expand the capacity of pattern languages in support of a hopeful new era of open-source, human-centered, life-enriching technology.

As an innovative thinker about building and planning, Christopher Alexander has attracted a devoted following. His seminal books--The Timeless Way of Building, A Pattern Language, and The Oregon Experiment--defined a radical

and fundamentally new process of environmental design. Alexander now gives us the latest book in his series--a book that puts his theories to the test and shows what sort of production system can create the kind of environment he has envisioned. The Production of Houses centers around a group of buildings which Alexander and his associates built in 1976 in northern Mexico. Each house is different and the book explains how each family helped to lay out and construct its own home according to the family's own needs and in the framework of the pattern language. Numerous diagrams and tables as well as a variety of anecdotes make the day-today process clear. The Mexican project, however, is only the starting point for a comprehensive theory of housing production. The Production of Houses describes

seven principles which apply to any system of production in any part of the world for housing of any cost in any climate or culture or at any density. In the last part of the book, "The Shift of Paradigm," Alexander describes, in detail, the devastating nature of the revolution in world view which is contained in his proposal for housing construction, and its overall implications for deep-seated cultural change.
