These figures can also be used to determine pipe sizes. D-3. Use the following steps andFigure D-1 to determine the size of the pipe, the velocity, and the friction loss from Point A to Point B: Step 1.

Pipe Sizes For Water Distribution System Design

Strict precautions must be taken in the design of water pipelines to prevent the entrance of contaminating materials into the pipeline supply of water for hygienic use or human consumption use. The water pipeline design shall layout backflow prevention devices (BPD) to eliminate cross-connection hazards.

Introduction to Pipe Design using Hazen-Williams Friction Losses This calculation is valid for water flowing at typical temperatures found in municipal water supply systems (40 to 75 o F, 4 to 25 o C). Our calculation is based on the steady state incompressible energy equation utilizing Hazen-Williams friction losses as well as minor losses.

Design of pipe work The safe yield of the water source is 0.25LPS. So in general we want to make sure that at no point in the system is more than 0.25LPS being drawn, as this will either empty a break pressure tank or the spring tank, allowing air into the system. We can do this in two ways.

This type of pipe is used for water supply work inside the building. These pipes are wrought steel pipes provided with zinc coating. They are available in light, medium and heavy grades depending on the thickness of the metal. For a 15 mm GI pipe, the thicknesses are 2.0, 2.65 & 3.25 for the light, medium and heavy grades, respectively.
