High levels of vibration are indicative of high levels of component stress, high noise levels and reduced machine fatigue life.

Measurements are usually taken of the system vibration amplitude, phase and frequency.

These measurements can be processed and displayed in such a way as to enable judgments to be made about the condition of the machine.

Sound is the mechanical vibrations of particles in a medium. When a sound wave is introduced in a material, the particles in the material vibrate about a fixed point at the same frequency as the sound wave. The particles do not travel with the wave but react to the energy of the wave. It is the energy of the wave that moves through the material.

Vibration – Wikipedia

Noise is an obvious outcome of vibrations in machines and structural components. Any improvement in quality of city life calls for implementation of hearing conservation programme in the community, by way of increasing public awareness and also through enforcement of noise level regulations.
