I have a problem with this exercise given by the professor for home. It's about Lyapunov equation and autonomous systems. Here it is: Prove that if the state of equilibrium $x^* = 0$ ($x^* \in \mathbb{R}^n$) of the system: $\dot{x}(k+1) = e^{A} x(k)$ with $A \in \mathbb{R}^{n \times n}$ is asymptotically stable then even the equilibrium state $x^{**} = 0$ of the system: $x' = Ax(t)$ is asymptotically stable.

Abstract. Finite-time stability involves dynamical systems whose trajectories converge to a Lyapunov stable equilibrium state in finite time. In this paper, we address finite time stability of discrete-time dynamical systems. Specifically, we show that finite time stability leads to uniqueness of solutions in forward time.

to prove stability of origin for $\dot{x} = -a(t)x$ Because your system has time varying parameters. It is autonomous, and time varying. What you need to do is to construct a time varying Lyapunov function, and in the process you will encounter when a Lyapunov function is said to be descreascent, etc. Those are not a part of the classical Lyapunov theory, which deals with time-invariant, autonomous system.

The book subsequently establishes a framework for non-autonomous dynamical systems, and in particular describes the various approaches currently available for analysing the long-term behaviour of non-autonomous problems. Here, the major focus is on the novel theory of pullback attractors, which is still under development.

In the theory of ordinary differential equations, Lyapunov functions are scalar functions that may be used to prove the stability of an equilibrium of an ODE. Named after the Russian mathematician Aleksandr Mikhailovich Lyapunov, Lyapunov functions are important to stability theory of dynamical systems and control theory. A similar concept appears in the theory of general state space Markov chains, usually under the name Foster – Lyapunov functions. For certain classes of ODEs, the existence ...

Lyapunov Stability • Definition: The equilibrium state $x = 0$ of autonomous nonlinear dynamic system is said to be stable if:
• Lyapunov Stability means that the system trajectory can be kept arbitrary close to the origin by starting sufficiently close to it

In dynamical systems, an orbit is called Lyapunov stable if the forward orbit of any point is in a small enough neighborhood or it stays in a small (but perhaps, larger) neighborhood. Various criteria have been developed to prove stability or instability of an orbit.

Finite time stability is defined for continuous non autonomous systems. Starting with a result from Haimo Haimo (1986) we then extend this result to n – dimensional non autonomous systems through the use of smooth and nonsmooth Lyapunov functions as in Perruquetti and Drakunov (2000).
