The best-fit line given by the equation  $y = r \frac{SD_y}{SD_x} (x - \overline{x}) + \overline{y}$

$y = r \frac{SD_y}{SD_x} (x - \overline{x}) + \overline{y}$

$\overline{y} =$

$\frac{rSD_y}{SD_x}(x - \overline{x}) + \overline{y}$

# Read Free Practice Linear Regression Problems

$y = S D x r S D y (x ? x)$  is actually known as the least squares regression line, which means that if we sum the square of the vertical distance from each data point to the best-fit line, the result will be less than it would be for any other line.

## ~~Practice Problems ...~~ Statistics With Answers

Mathematically, regression uses a linear function to approximate (predict) the dependent variable given as:  $Y = \beta_0 + \beta_1 X + \epsilon$  where,  $Y$  - Dependent variable  $X$  - Independent variable  $\beta_0$  - Intercept  $\beta_1$  - Slope  $\epsilon$  - Error.  $\beta_0$  and  $\beta_1$  are known as coefficients. This is the equation of simple
