Postures that depend on balance abilities require significant attention to maintain control (Woollacott & Shumway-Cook, 2002). In elderly, balance-impaired adults, for example, falls frequently occur when they are walking and simultaneously performing a secondary task, such as talking ( Shumway-Cook & Woollacott, 2000 ).

Motor Control is the only text to bridge the gap between current motor control research and its applications to clinical practice. The text prepares therapists to examine and treat patients with problems related to balance, mobility, and upper extremity function, based on the best available evidence supporting clinical practice. The Third Edition features a new two-color design with an updated art program. This edition provides the latest research findings and their clinical applications in postural control, mobility, and upper extremity function. Drawings, charts, tables, and photographs are also included to clarify postural control and functional mobility, and laboratory activities and case studies are provided to reinforce key concepts.

This fully revised edition stresses the scientific and experimental bases of new motor control theories, and explains how principles can be applied to clinical practice. The book presents many theories of motor control, but focuses on a systems theory of motor control and a clinical or "task-oriented" approach to examination and intervention. Features include: laboratory activities to demonstrate concepts; a new chapter on impairments that constrain functional movement in patients with neurologic pathology; a revised section on manipulatory function disorders; and case studies to help readers apply concepts to patients with different diagnoses. All chapters include an outline, key terms, learning boxes, and a summary.

The proliferation of new research in the field of neuroscience and motor control has made it difficult to keep pace with the latest findings. This text bridges the gap between research/theory and practice by focusing on the scientific and experimental basis of new motor control theories. Specific examples of theoretical models are provided to clearly illustrate how recent findings and theories can be applied to clinical practice. Each chapter includes an outline, key terms in boldface type, active learning boxes, and a chapter summary to ensure maximum comprehension of the material. The text is intended for physiotherapy and occupational therapy students.

Motor Control is the only text to bridge the gap between current motor control research and its applications to clinical practice. This edition provides the latest research findings and their clinical applications in postural control, mobility, and upper extremity function. Drawings, charts, tables, and photographs are also included to clarify postural control and functional mobility, and laboratory activities and case studies are provided to reinforce key concepts. Videos on the back-of-book DVD examine motor control deficits, including deficits in postural control, mobility, and upper extremity function in different types of neurologic pathology (stroke, cerebellar pathology, cerebral palsy, and Parkinson's disease) as well as in balance impaired elders. These videos can be viewed in their entirety or in the following segments: impairments, postural control, mobility, and upper extremity control. This video enhances the clinical coverage found in the textbook.

Extensively illustrated and easy to use, this practical resource offers clear guidelines and step-by-step sequences for moving and working with individuals with differing levels of paralysis. It serves as both an ideal student textbook and a valuable clinical manual for therapists who see tetraplegic and paraplegic patients. Clear, practical, concise chapters present important information in an easily understandable approach. Spiral-bound format enables the book to lay flat for easy reference in the clinical setting or classroom. Excellent coverage of wheelchairs and wheelchair management is included. All illustrations have been redrawn for increased clarity, to enhance the clinical usefulness of this resource. Audit and evidence-based practice is incorporated throughout. Discussion of patient empowerment is included. The chapter on hands has been expanded to provide more in-depth coverage of this important topic. New discussion of levers has been added to this edition. New chapter on aging offers insight and considerations for treating aging and elderly patients with spinal cord injury. Expanded section on equipment provides details on current and state-of-the-art equipment used in practice.

The second edition of the Neurological Physiotherapy Pocketbook is the only book for physiotherapists that provides essential evidence-based information in a unique and easy-to-use format, applicable to clinical settings. Written by new international editors and contributors, this pocketbook provides quick and easy access to essential clinical information.

This book is the first to view the effects of development, aging, and practice on the control of human voluntary movement from a contemporary context. Emphasis is on the links between progress in basic motor control research and applied areas such as motor disorders and motor rehabilitation. Relevant to both professionals in the areas of motor control, movement disorders, and motor rehabilitation, and to students starting their careers in one of these actively developed areas.

The approach here is based on the concepts set out by Dr. Herman Kabat and taught by Margaret Knott, and this second edition adds many new illustrations including demonstrations of the techniques and pictures of actual patient treatment. The gait section has been expanded with an introduction to normal components and photos of patient treatment. The mat section has also been enlarged and includes illustrations of patient treatment.

The neuro rehab text that mirrors how you learn and how you practice! Take an evidence-based approach to the neurorehabilitation of adult and pediatric patients across the lifespan that reflects the APTA 's patient management model and the WHO 's International Classification of Function (ICF). You 'll study examination and interventions from the body structure/function impairments and functional activity limitations commonly encountered in patients with neurologic disorders. Then, understanding the disablement process, you 'll be able to organize the clinical data that leads to therapeutic interventions for specific impairments that can then be applied as appropriate anytime that impairment is detected, regardless of the medical diagnosis.
