The ALL operator returns TRUE if all of the subquery values meet the condition. The following SQL statement returns TRUE and lists the product names if ALL the records in the OrderDetails table has quantity = 10 (so, this example will return FALSE, because not ALL records in the OrderDetails table has quantity = 10):

By: Douglas P. Castilho | Updated: 2019-05-03 | Comments (94) | Related: More > T-SQL Problem. I need a way to roll-up multiple rows into one row and one column. I know I can roll-up multiple rows into one row using Pivot, but I need all of the data concatenated into a single column in a single row. In this tip we look at a simple approach to accomplish this.

~~Rolling up multiple rows into a single row and column for -~~

ALL & ANY are logical operators in SQL. They return boolean value as a result. ALL. ALL operator is used to select all tuples of SELECT STATEMENT. It is also used to compare a value to every value in another value set or result from a subquery. The ALL operator returns TRUE iff all of the subqueries values meet the condition.

SQL All -In-One For Dummies, 3rd Edition, is a one-stop shop for everything you need to know about SQL and SQL-based relational databases. Everyone from database administrators to application programmers and the people who manage them will find clear, concise explanations of the SQL language and its many powerful applications.

~~SQL All in One For Dummies, 3rd Edition (For Dummies -~~

The SQL ALL operator is a logical operator that compares a single value with a single-column set of values returned by a subquery. The following illustrates the syntax of the SQL ALL operator: WHERE column\_name comparison\_operator ALL (subquery)

~~SQL ALL Operator By Practical Examples~~

ALL requires the scalar\_expression to compare positively to every value that is returned by the subquery. For instance, if the subquery returns values of 2 and 3, scalar\_expression <= ALL (subquery) would evaluate as TRUE for a scalar\_expression of 2.
